

Cast Copper Rotors Efficiency Test Results

Darryl Van Son
Van Son Consultants

*Presentation to the
Copper Development Association
Annual Spring Meeting
June 7, 2001
New York*

What is 1% motor efficiency worth?

- **Two-thirds (2/3) of all electricity is used to run motors**
- **Motors use 2 Trillion KWHr per year**

1% better motor efficiency would save:

- **20 Billion KWHr per year**
- **\$1.4 Billion at 7 cents per KWHr**
- **Equivalent to 36.5 Million barrels of oil**

Direct Copper to Aluminum Comparison

- **7 rotors tested in the same stator**
- **All tested on the same dynamometer**
- **Copper rotors compared to a large data base of previous motor tests**
- **Aluminum rotor motors averaged into a “standard” motor**

IEEE – 112B Efficiency Test

- **Iron core loss** – Magnetic losses in lamination stack, inductance and eddy current losses
- **Stator resistance** – current losses in windings
- **Rotor resistance** – current losses in rotor bars and end rings
- **Windage and friction** – mechanical drag in bearings and cooling fans
- **Stray load losses** – magnetic transfer loss in the air-gap between rotor and stator

IEEE Loss Segregation Test Results

| | Watts Loss | | | |
|---------------------------|-------------------|-------------------|---------------------|-----------------------|
| | <u>Al</u> | <u>Cu</u> | <u>Diff.</u> | <u>Percent</u> |
| Stator resistance | 507 | 507 | 0 | 0% |
| Iron core loss | 286 | 286 | 0 | 0% |
| Rotor resistance | 261 | 157 | -104 | -40% |
| Windage / friction | 115 | 72 | -43 | -37% |
| Stray load loss | <u>137</u> | <u>105</u> | <u>-32</u> | <u>-23%</u> |
| Total losses | 1306 | 1127 | -179 | -14% |

IEEE Performance Test (1)

| | <u>Al</u> | <u>Cu</u> | <u>Diff.</u> | <u>Percent</u> |
|------------|-----------|-----------|--------------|----------------|
| Efficiency | 89.5% | 90.7% | +1.2 | +1.4% |
| Losses | 10.5% | 9.3% | -1.2 | -11.4% |

- **Added 1.2 percentage points to the nameplate**
- **Reduced losses by 11.4%**

| | <u>Al</u> | <u>Cu</u> | <u>Diff.</u> | <u>Percent</u> |
|--------------|-----------|-----------|--------------|----------------|
| Power Factor | 81.5% | 79.0% | +2.5 | -3.0% |

- **Does not directly affect power usage**
- **Power factor corrected on a whole plant basis**

IEEE Performance Test (2)

| | <u>Al</u> | <u>Cu</u> | <u>Diff.</u> | <u>Percent</u> |
|---------------|-----------|-----------|--------------|----------------|
| Full Load RPM | 1760 | 1775 | +15 | +1% |
| Slip | 2.22% | 1.37% | -0.85 | -38% |

- Slip is the difference between the full load speed of the rotor/shaft versus the synchronous speed of the rotating electrical field in the stator – 1800 RPM
- Copper rotor motor is a very “stiff” motor
- Implies a very good motor on variable speed drives for Servo-like performance
- Potential problems on Centrifugal loads
- Fans and pumps follow the Cube Law: 1% increase in speed = 3% increase in power input

IEEE Performance Test (3)

| | <u>Al</u> | <u>Cu</u> | <u>Diff.</u> | <u>Percent</u> |
|------------------|-----------|-----------|--------------|----------------|
| Temperature rise | 64.9C | 59.5C | -4.5C | -7% |

- **Affects life expectancy of the motor**
- **For every 10 degrees C hotter a motor runs, life can be reduced in half**
- **With nearly 5 degrees C cooler running, Copper rotor motors could increase life expectancy by 50%**
- **Similar results have been seen in premium efficiency motors since their introduction 20 years ago**

Torque Issues

Pound Feet

| | <u>Al</u> | <u>Cu</u> | <u>Diff.</u> | <u>Percent</u> |
|-------------------------|------------------|------------------|---------------------|-----------------------|
| Starting Torque | 58.2 | 37.0 | -21.2 | -36% |
| Breakdown Torque | 152.0 | 125.9 | -26.1 | -17% |
| Locked Rotor | 69.0 | 65.0 | -4.0 | -6% |

- **Down from historically very high levels**
- **Still within NEMA minimum requirements**
- **Locked rotor torque still very good**
- **Can be corrected with modification to the rotor slot shape**

Copper Rotor Consistency

- **Copper rotor motors averaged 90.7% efficiency
Range: 90.6% – 90.8%**
- **Copper rotor losses averaged 157 Watts
Range: 153 Watts – 167 Watts**
- **Process variables had no predictable effect on final test results**
- **No balancing weights were required**
- **This is a very robust process with consistency not seen in current rotor die casting methods**

Additional Implications

- **Higher efficiency in the same stack length**
- **Same efficiency in a reduced stack length**
Offsetting material cost differences
- **Some combination in between**
- **Elimination of balancing procedure in production**
- **Elimination of “safety factor” extra stack length to compensate for rotor irregularities**

Motors designed around a Copper rotor

Tests of an “optimized” Copper motor

- Rotor losses -40%
- Total losses -23%
- Temperature rise -70%
- Efficiency +1.6% 90.9% vs. 92.5%

Stator windings and iron core were modified from standard motor design to gain best possible results

20 HP Motor, Past and Future
